## WHAT IS CLAIMED IS:

- 1. A method for producing a subunit peptide originating from an oligomeric protein having disulfide bonds within a subunit and between subunits, which comprises the following steps:
- (a) a step of refolding the subunit peptide by denaturing the oligomeric protein or its subunit peptide in a solution with a protein-denaturing agent and removing the denaturing agent from the solution in the presence of polyoxyalkyl polyether having a functional group that reacts with a thiol group; and
- (b) a step of isolating the subunit peptide bonded to the polyoxyalkyl polyether from the solution.
- The method according to Claim 1, wherein the subunit peptide isolated in step (b) has decreased antigenicity.
- 3. The method according to Claim 1, wherein the oligomeric protein is a dimer.
- 4. The method according to Claim 1, wherein the polyoxyalkyl polyether having the functional group that reacts with the thiol group is polyethylene glycol having a maleimide group.
- 5. The method according to Claim 1, wherein the subunit peptide originating from the oligomeric protein is a recombinant protein.

- 6. The method according to Claim 1, wherein the oligomeric protein or its subunit peptide is denatured under reducing conditions.
- 7. The method according to Claim 1, wherein a physiological activity of the oligomeric protein arises from a subunit peptide constituting the oligomeric protein, and the subunit peptide bonded to polyoxyalkyl polyether has the physiological activity.
- 8. The method according to Claim 1, wherein the subunit peptide bonded to polyoxyalkyl polyether has an activity of inhibiting a physiological activity of the oligomeric protein.
- 9. The method according to Claim 1, wherein the polyoxyalkyl polyether is bonded to a cysteine residue that is originally involved in formation of a disulfide bond between subunits in the oligomeric protein, among cysteine residues in the subunit peptide.
- 10. The method according to Claim 1, wherein the subunit peptide bonded to polyoxyalkyl polyether has a disulfide bond identical to a disulfide bond within the subunit in the oligomeric protein.
- 11. A subunit peptide originating from an oligomeric protein having disulfide bonds within a

subunit and between subunits, wherein

polyoxyalkyl polyether is bonded to a cysteine residue that is originally involved in formation of a disulfide bond between subunits of the oligomeric protein, among cysteine residues in the subunit peptide, and the subunit peptide has decreased antigenicity.

- 12. The subunit peptide according to Claim 11, wherein the oligomeric protein is a dimer peptide that originates from snake venom and has an activity of inhibiting binding of a von Willebrand factor to a platelet.
- 13. The subunit peptide according to Claim 12, wherein the snake venom is snake venom of Crotalus horridus horridus.
- 14. The subunit peptide according to Claim 12, which exhibits an antithrombotic activity.
- 15. The subunit peptide according to Claim 14, which is a peptide having the amino acid sequence shown in SEQ ID NO: 1 and having polyoxyalkyl polyether bonded to the cysteine residue of amino acid number 81 in the amino acid sequence, or a derivative thereof.

## DISCLOSURE OF THE INVENTION

It is provided a method for producing a subunit peptide originating from an oligomeric protein having disulfide bonds within a subunit and between subunits. The method comprises producing a subunit originating from an oligomeric protein having disulfide bonds within a subunit and between subunits by the following steps:

- (a) a step of refolding the subunit by denaturing the oligomeric protein or its subunit in a solution with a protein-denaturing agent and removing the denaturing agent from the solution in the presence of polyoxyalkyl polyether having a functional group that reacts with a thiol group; and
- (b) a step of isolating the subunit bonded to the polyoxyalkyl polyether from the solution.
